

MISSOURI PUBLIC HEALTH STATISTICS VITAL STATISTICS

1968

Prepared by
Bureau of Statistical Services
October, 1969

DEPARTMENT OF PUBLIC HEALTH AND WELFARE OF MISSOURI

DIVISION OF HEALTH
BROADWAY STATE OFFICE BUILDING
JEFFERSON CITY, MISSOURI 65101

PREFACE

This is the final tabulation of statistical data relating to vital events in Missouri during 1968. This annual report of Vital Statistics was compiled for use in Public Health and related fields, as an aid for studying births, deaths, marriages and divorces. This is published as part of the Public Health Statistics series.

While there is no additional information in this years report, there has been some revision. The classification of causes of death have been changed to comply with the EIGHTH REVISION OF THE INTERNATIONAL CLASSIFICATION OF DISEASES, ADAPTED, 1967.

The appearance and size of this report has received considerable alteration. Electronic data processing is being used for the first time in preparing this report and the report itself is reprinted from actual EDP printouts. With programming behind us for next year we expect the 1969 Annual Vital Statistics Report to be available several months earlier than has been the case in past years.

BUREAU OF STATISTICAL SERVICES

1969

COMPILATION AND UTILIZATION

Vital Statistics in Missouri are compiled from five documents which are filed with the Division of Health by State Law. To obtain the fullest use of these records, many sources of data must be utilized, including population, social science, medical, statistical, and demographic literature. Vital data are of little value unless special care is taken to analyze the cause and effect of the trends in vital events. To do this, knowledge and understanding of considerable background material are necessary. In Missouri, the five basic records on file with the Division of Health are: (1) birth records, (2) death records, and (3) fetal death records, each beginning with 1910; (4) marriage, and (5) divorce records; beginning with 1948. Much use is made of the data concerning vital events because they play such an important part in both our economy and social structure. The births that occur today will affect the sale of childrens' toys, the construction of schools, the number of homes to be built for future families and the aging population. People interested in these problems and others must turn to vital statistics for source and background data.

The economic and social factors which are affected by the occurrence of vital events, in turn, are significant in the present and future health of the people of Missouri.

RELIABILITY OF THE DATA

Statistics are neither more true nor more false than the interpretation given to them. Figures cannot be wrong until we interpret them as representing a specific thing. The value of the datalessens as the knowledge of the person using a specific kind of data decreases. Reports published by the Bureau of Vital Statistics are limited in their scope by the amount of time and money available for their publication. They are published in a form standardized for use by vital statisticians. This means that certain facts must be realized if knowledge is to be gained from the use of these reports. A novice can best ask for advice from a person trained in the use of statistics, their collection, tabulation, and interpretation. The main sources of error found in vital statistics are: underregistration¹, improper tabulation procedure, poor response or indifference on the part of those responsible for completing vital records, and probably the most dangerous source of error, improper interpretation.

Age and sex distribution together with social and economic conditions play a large part in the health of the people of any state. Missouri counties have a range in age from one county with one-half of its people under 21 years of age to another with one-half of the people over 40 years of age. A county that has a population composed primarily of younger persons might present a fictitious picture of good health if the number of deaths is used as a measure of health. The reverse could be true in a county composed predominantly of older persons.

POPULATION

Population data used for computing rates shown in this report were obtained from the following sources: Population Estimates, 1911-1950, taken from the United States Bureau of the Census Release, Series P-25, No. 139, June 27, 1965; 1960 population taken from United States Census of Population, "General Characteristics," PC(1) 27B; 1951-1959 and 1961 to date as computed by the Missouri Division of Health, Statistical Services. The components used to compute the 1961 to date estimates² were the net change, natural increase and net migration. The net migration based upon the experience during the period 1950-1960.

USE OF THE TERMS "RECORDED" AND "RESIDENT"

Historically, vital statistics have been presented in two forms, "Recorded" and "Resident". It is important to understand the significance of these terms when analyzing vital statistics. As an example, this report might show birth data as follows for two selected areas (1965 figures):

Recorded live births, City of Springfield - 3,377 Resident live births, City of Springfield - 1,780 Recorded live births, Gasconade County - 3 Resident live births, Gasconade County - 156

What accounts for the difference in the above birth numbers? The differences are between the recorded and resident births of an area, due mainly to facilities available in the area. In the first case, people are coming into a city to have their babies, because of the medical facilities available. In the second case, people are leaving an area to have their babies.

"Recorded" data are based on the number of vital events that occur in an area. These data are used to analyze events that might be affected by the place in which they occur.

"Resident" data are compiled for vital events that relate to persons residing in an area independent of where the events occurred. (A person is considered to be a resident of an area if he has resided there six months or more. In the case of live births, fetal deaths, and infant deaths, the residence of the mother is considered to be the residence of the child).

RACE AND COLOR

The category "White" includes, in addition to persons reported as white, those reported as Mexican, Puerto Rican, Chinese, Japanese, Indian, except Negro. In other words, persons reported as Negro are recorded as "Nonwhite"; all other classes are recorded as "White". Any person reported as a mixed race which includes Negro is recorded as "Nonwhite".

CAUSE OF DEATH CLASSIFICATION

The causes of death presented here were classified in accordance with the Eighth Revision International Classification of Diseases, Adapted, Public Health Service Publication No. 1693, from the U. S. Government Printing Office.

PROCEDURES FOR RATES AND WHOLE NUMBERS

The rounding of numbers in this report was accomplished by dropping any digit in the hundreths position of the calculated rate or percent. Therefore, when the rate or percent is less than one-tenth the entry has been left blank.

In the case of whole numbers if a blank or dash (-) is shown, this means none or zero (0).

¹ This report includes the marriages and divorces reported to this office. There are a few counties which did not report any of these events. In some cases this may be a true picture of the occurrences in those counties; in others, it represents underreporting. This report does not include information from those Missouri residents who marry and seek divorce outside of the State. As yet, there is no interchange between states of these events. As State laws change, this causes changes in the rate which may not represent a true picture. Thus, a tightening of divorce laws may drop the reported divorce rate but not the resident rate. These data are recorded.

²Estimates computed as of April, 1969.

TABLE OF CONTENTS

BIRTHS, FETAL DEATHS, DEATHS, INFANT DEATHS, MATERNAL DEATHS, ACCIDENTS

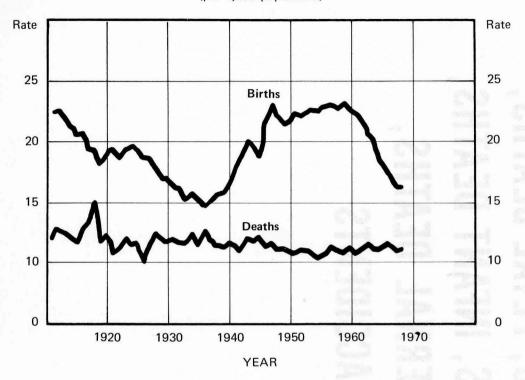

Table/	Graph		Page
	Α	Trends in Live Birth and Death Rates, 1911-1968	2

PERCENTAGES ARE COMPUTED ON THE BASIS OF TOTAL WHITE AND NONWHITE LIVE BIRTHS.

URBAN AREAS INCLUDE CITIES OVER 10,000 POP. ACCORDING TO 1960 CENSUS.

ALL OTHER AREAS ARE INCLUDED IN 'RURAL'.
